# Unibond PRC<sub>18</sub>/ PRC<sub>8</sub>-

#### Key features

- Decrease of analysis time (ultra fast HPLC)
- Shorter columns with high separation efficiency
- Significant improvement of resolution and detection sensitivity
- Suitable for LC/MS due to low bleeding characteristics
- Unibond 1.8 μm particles are fractionated to limit the increase in back pressure

Unibond PRC<sub>18</sub>/ PRC<sub>8</sub>

P = Particular

R = Robust

C = Column

#### Advantages of 1.8 µm particle size

Miniaturization in HPLC has a long history. It started in the early stage of HPLC development with the reduction of particle size from 10  $\mu m$  via 7  $\mu m$  to standard 5  $\mu m$  – which is still the most widely used particle diameter in analytical HPLC – to 3  $\mu m$  spherical particles which so far was the smallest particle size available for gaining higher theoretical plates and efficiencies. With the introduction of 1.8  $\mu m$  **Unibond** particles researchers have turned over a new leaf in HPLC column technology. Columns packed with these microspherical particles show extraordinary improvements in terms of plate numbers, column efficiencies and resolution compared with their 3  $\mu m$  counterparts.

#### Column back pressure

Due to the smaller particle size the back pressure will increase according to

$$\Delta_{P} = \frac{\Phi \cdot L_{C} \cdot \eta \cdot u}{d_{P}^{2}}$$

 $\Delta_{\mathsf{P}}$  = pressure drop

 $\Phi$  = flow resistance (nondimensional)

L<sub>C</sub> = column length

η = viscosity

u = linear velocity

d<sub>P</sub> = particle diameter

Because of the high sphericity of the Unibond particles and the very narrow particle size distribution we were able to keep the back pressure on a moderate level. Nevertheless the use of columns packed with sub 2  $\mu m$  particles generally makes special demands on the HPLC equipment. Pumps should be designed for pressures of 250–1000 bars and the entire system should feature the lowest possible dead volume.

#### Comparison of back pressures:

Eluent: 100 % methanol Flow rate: 1.5 mL/min Temperature: 22 °C Column dimension: 50 x 4.6 mm

	Unibond PRC <sub>18</sub>	Competitor A
3 µm 1.8 µm	70 bar 130 bar	– 170 bar
'		

#### Features of 1.8 µm Unibond PRC<sub>18</sub>

Increase of separation efficiency by higher number of theoretical plates (N):

50 x 4.6 mm Unibond PRC<sub>18</sub>

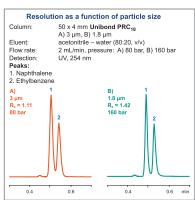

3 µm: N ≥ 100 000 plates/m (h value ≤ 10) 1.8 µm: N ≥ 166 667 plates/m (h value ≤ 6)

Increase of the plate number by app. 67 % offers the possibility of using shorter columns with equal plate numbers resulting in a decrease of analysis time.

#### Significant improvement in resolution

Use of 1.8  $\mu$ m instead of 3  $\mu$ m particles leads to an increase of resolution by a factor 1.29 (29%) since the resolution is inversely proportional to the square root of the particle size:

$$\begin{split} R_s &= \frac{\sqrt{N}}{4} \left(\frac{\alpha-1}{\alpha}\right) \left(\frac{k_i{'}}{k_i{'}} + 1\right) \\ R_s &= \text{resolution} \\ \alpha &= \text{selectivity (separation factor)} \\ k_i{'} &= \text{retention} \\ N &= \text{plate number with N} \propto 1/d_p \\ d_p &= \text{particle size} \end{split}$$

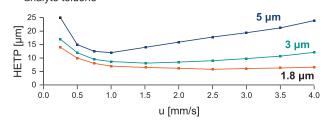

#### Higher flow rates and shorter run times

optimal flow rate for 1.8  $\mu m$  particles is higher than for 3 and 5  $\mu m$  particles (see figures – the flow rate should be at the van-Deemter minimum)

#### Van-Deemter plot

column 50 x 4.6 mm, acetonitrile – water (50:50, v/v), analyte toluene

# Nonpolar high density phases

The following chromatograms demonstrate the stability of Unibond PRC<sub>18</sub> under alkaline conditions in comparison with 4 commercially available modern RP18 phases. Again, the ultrapure with its unique high density surface bonding technology withstands strong alkaline mobile phase conditions. Even after 300 injections no loss of column efficiency, identified, e.g., by peak broadening or decrease in retention times, could be observed.

# Stability of UNIBOND PRC $_{18}$ under alkaline conditions compared with different $C_{18}$ phases

Columns: 50 x 4.6 mm

Eluent: methanol – water – ammonia

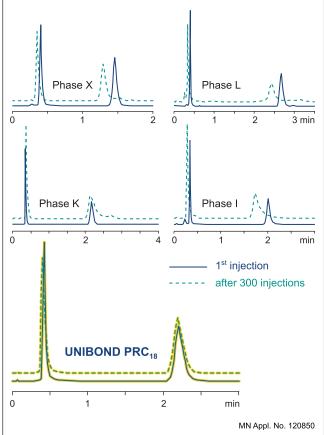

(20:80:0.5, v/v/v), pH 11

Flow rate: 1.3 mL/min Temperature: 30 °C Detection: UV, 254 nm Injection volume: 2.0  $\mu$ L

Peaks:

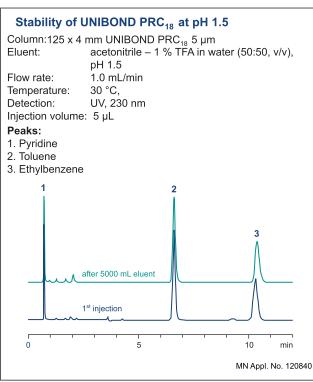

1. Theophylline

2. Caffeine

The pH stability of silica under alkaline conditions is mainly a kinetic effect and based on the velocity of the dissolution of the silica support. It is worth men tioning, that this phenomenon also depends on type and concentration of buffers, as well as on the temperature. It is well known, that the use of phosphate buffers, particularly at elevated temperatures, can reduce column lifetime even at moderate pH. If possible, phosphate buffers should be replaced by less harmful alternatives.

The following chromatograms show the excellent column stability of UNIBOND PRC<sub>18</sub> in acidic conditions. The retention time of all three compounds in the column performance test remains consistent and virtually unchanged, even after the column is run with 5000 mL eluent. Due to the extremely stable surface modification, no cleavage of the Si-O-Si bonding occurs, column deterioration is therefore successfully prevented.

# UNIBOND PRC<sub>18</sub> / PRC<sub>8</sub>

#### Key features:

- Suitable for LC/MS and HPLC at pH extremes (pH 1–11)
- Superior base deactivation
- Ideal for method development

#### Technical characteristics:

Available as octadecyl (C  $_{18}$ ) and octyl (C  $_8$ ), multi-endcapped; pore size 110 Å; particle sizes 1.8  $\mu$ m, 3  $\mu$ m and 5  $\mu$ m for C $_{18}$ , 1.8 and 5  $\mu$ m for C $_8$ ; 7, 10, 12 and 16  $\mu$ m particles for preparative purposes on request; carbon content 18% for C $_{18}$ , 11% for C $_8$ 

#### Recommended application:

Overall sophisticated analytical separations

Compound classes separated include: pharmaceuticals, e.g., analgesics, anti-inflammatory drugs, antidepressants; herbicides; phytopharmaceuticals; immunosuppressants

USP L1 (C<sub>18</sub>)/USP L7 (C<sub>8</sub>)

#### **Base deactivation**

UNIBOND PRC<sub>18</sub> AND UNIBOND PRC<sub>8</sub> are based on the ultrapure silica.

A unique derivatization process generates a homogeneous surface with a high density of bonded silanes (carbon content ~18  $\,$ % for C $_{18},\,$  ~11 % for C $_{8}$ ). The following thorough endcapping suppresses any unwanted polar interactions between the silica surface and the sample, particularly suitable for

the separation of basic and other ionizable analytes. The figure on the right shows a comparison study, where the strongly basic amitriptyline is eluted on various highly base deactivated C  $_{\rm 18}$  phases under isocratic conditions.

#### **Tanaka diagrams**

Several UNIBOND phases have been examined in accordance with Tanaka et al. [J. Chromatogr. Sci. 27 (1989) 721] and Johnson et al. [Chromatographia 44 (1997) 151] with respect to the following parameters:

Capacity = k'(pentylbenzene)

**Hydrophobicity** =  $\alpha$ (pentylbenzene, butylbenzene)

**Steric selectivity** =  $\alpha$ (triphenylene, *o*-terphenyl)

Hydrogen bonding capacity (silanol capacity) =  $\alpha$ (caffeine, phenol)

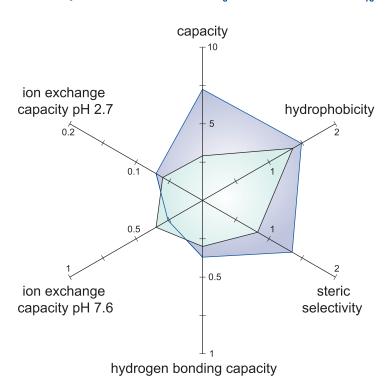

**Ion exchange capacity** at 2 different pH values (2.7 and 7.6) =  $\alpha$ (benzylamine, phenol)

The resulting Tanaka plots are shown with the respective phases.

#### **Enhanced pH stability**

One major disadvantage of using silica stationary phases is the limited stability at strongly acidic or basic pH ranges. Cleavage of the siloxane bonding by hydrolysis, or dissolution of the silica will rapidly lead to a considerable loss in column performance. Therefore conventional RP phases are usually not recommended to be run with mobile phases at pH > 8 or pH < 2 for extended periods of time. The special surface bonding technology and the low concentration of trace elements of UNIBOND PRC8 / PRC18 allow for use at an expanded pH range from pH 1 to 11.

#### Tanaka plots of UNIBOND PRC<sub>8</sub> AND UNIBOND PRC<sub>18</sub>

#### When is enhanced pH stability beneficial?

The option to work at an expanded pH range is often required in method development. Many nitrogen containing compounds like basic drugs are protonated at acidic or neutral pH and exhibit poor retention on a standard C <sub>18</sub> phase. The retention behavior can be improved by working at a higher pH, where the analyte is no longer protonated, but formally neutrally charged, as a rule between pH 9–10. For acidic analytes it is exactly in inverse proportion, maximum retention can be attained at low pH.

## **Summary of MN phases for GC**

MN offers more than 40 different phases for gas chromatography, from very nonpolar to polar columns.

Nonpolar stationary phases (e.g., 100 % dimethylpoly siloxane phases) separate by volatility (i.e. boiling point) only. Typical analytes are linear hydrocarbons (*n*-alkanes).

Polar phases offer additional interactions that may improve a separation. When the polarity is increased, e.g., by introducing phenyl and / or cyanopropyl groups, differences in dipole moment and charge transfer effects, e.g., in 5–50 % diphenylpolysiloxane phases, gain more and more influence on the separation. Typical analytes are hydrocarbons containing oxygen, sulfur, nitrogen, phosphorus or halogens, as well as unsaturated, polarizable molecules and aromatics.

For the separation of components with various abilities to form strong hydrogen bonds, polyethylene glycol phases (WAX) are the best choice. Typical analytes are alcohols and carboxylic acids.

The selectivity of a column has to be optimized for either the critical pair of components, or the main constituent. Always select the least polar column your separation works on. About 70% of all separations can be accomplished on non- to midpolar columns. These columns generally show a high temperature stability.

- First temperature for isothermal operation, second value for short isotherms in a temperature program

  Please note that for columns with 0.53 mm ID and for columns with thicker films temperature limits are generally lower.

  For details refer to the description of individual phases.
- <sup>2</sup> Phases which provide a similar selectivity based on chemical and physical properties

Each column is individually tested and supplied with test certificate and test chromatogram, but without fittings or ferrules. Columns have fused ends or are sealed with septa, to protect them from atmospheric oxygen. A standard test mixture is in cluded with every column.

On request, all columns can be supplied on a **5 inch (13 cm) cage** for the Agilent GC 6850. To order, please add an E at the end of the REF number (e.g., 726470.30E)

To prolong column life, even at highly contaminated or matrix-containing samples, MN offers the option to add an **integrated guard column**. All capillary columns are available with a 10 m guard column with respective deactivation. To order, please add V1 at the end of the REF number. Guard column combinations with other lengths, IDs or different deactivation are available on request.

# Capillary columns for special separations

#### **Columns for Fast GC**

- Characteristics of Fast GC: decreased column diameters, high heating rates and decreased column lengths for faster GC separations with high resolution efficiency; small inner diameters combined with very fast temperature programs can reduce the analysis time by up to 80%
- High heating rates place special demands on stationary phases: OPTIMA® columns meet exactly this requirement: very low bleeding, long lifetimes, even for continuous high heating rates
- System requirements for Fast GC: high sensitivity detectors with small volume and very short response time, as well as very rapid data acquisition and processing · small inner diameters result in high column inlet pressures and a lower volume flow of the mobile phase: very fast injec tion of very small samples against a high pressure · amount of sample, which can be injected, is limited by the inner diameter and the thin film

#### Comparison of a separation on a 50 m standard capillary with separation on a 10 m fast GC column B) standard GC column

A) Fast GC column

Column: OPTIMA® 5, 0.1 µm film, 10 m x 0.1 mm ID injection 1 µL, split 1:40, carrier gas 0.75 bar He

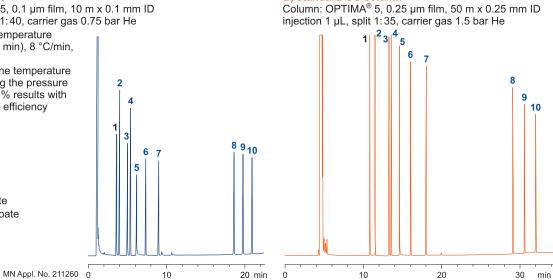

Both separations: temperature 80 °C → 320 °C (10 min), 8 °C/min,

detector: FID

While maintaining the temperature program and halving the pressure a time saving of 30 % results with identical separation efficiency

#### Peaks:

- 1. Octanol
- 2. Undecane
- 3. Dimethylaniline
- 4. Dodecane
- 5. Decylamine
- 6. Methyl decanoate
- 7. Methyl undecanoate
- 8. Henicosane
- 9. Docosane
- 10. Tricosane

#### **OPTIMA** ® XLB

Chemically bonded, cross-linked silarylene phase, optimized silarylene content for lowest column bleed

Similar phases: DB-XLB, Rxi-XLB, Rtx-XLB, MDN-12, VF-XMS

#### silarylene phase

Max. temperature for isothermal operation 340  $^{\circ}$ C, max. temperature for short isotherms in a temperature program 360  $^{\circ}$ C,

Lowest column bleed, nonpolar phase, ideal for ion trap and quadrupole MS detectors

Perfect inertness for basic compounds

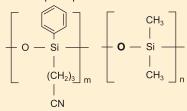

Solvent rinsing for removal of impurities applicable

Recommended application: ultra low bleed phase, highly selective for environmental and trace analyses, pesticides

Recommended phase for PCB separations

#### OPTIMA® 624

Medium polar phase

Similar phases: HP-624, HP-VOC, DB-624, DB-VRX, SPB-624, CP-624, Rtx-624, Rtx-Volatiles, 007-624, BP624, VOCOL

#### 6% cyanopropyl-phenyl - 94% dimethylpolysiloxane

Max. temperature for isothermal operation 280 °C, max. temperature for short isotherms in a temperature program 300 °C

Recommended application: environmental analyses

For corresponding columns with lower film thickness see OPTIMA® 1301

USP G43

#### OPTIMA® 624 LB

6% cyanopropyl-phenyl – 94% dimethylpolysiloxane

Excellent Low Bleed columns for halogenated hydrocarbons, volatiles, aromatic compounds, solvents etc.

# OPTIMA® high performance capillary columns

#### **OPTIMA** ® 1701

#### 14 % cyanopropyl-phenyl – 86 % dimethylpolysiloxane

Medium polar phase

$$\begin{bmatrix} & & & & & & \\ & & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & &$$

Similar phases: OV-1701, DB-1701, CP-Sil 19 CB, HP-1701, Rtx-1701, SPB-1701, 007-1701, BP10, ZB-1701

Max. temperature for isothermal operation 300 °C, max. temperature for short isotherms in a temperature program 320 °C 0.53 mm ID columns: max. temperatures 280 and 300 °C, resp.

Special selectivity due to high cyanopropyl content Reference column for structure identification, e.g., in combination with OPTIMA <sup>®</sup> 5 Film thickness ≥ 1 µm for solvent analyses

USP G46

#### OPTIMA® 35 MS

Chemically bonded cross-linked silarylene phase with selectivity similar to  $35\,\%$  phenyl  $-\,65\,\%$  methyl polysiloxane

$$\begin{bmatrix} CH_3 & CH_3 \\ I & CH_3 \\ SI - O \end{bmatrix}_m \begin{bmatrix} CH_3 & CH_3 \\ I & CH_3 \\ CH_3 & CH_3 \end{bmatrix}_n \begin{bmatrix} CH_3 \\ I & CH_3 \\ CH_3 & CH_3 \end{bmatrix}_n$$

Similar phases: DB-35 MS, HP-35, SPB-35, Rxi-35SIL MS, Rtx-35, 007-35, BPX-35, MDN-35, AT-35 MS, ZB-35, OV-11, VF-35 MS

# silarylene phase Max. temperature for isothermal operation

Max. temperature for isothermal operation 360 °C, max. temperature for short isotherms in a temperature program 370 °C,

 Very low column bleeding, medium polar phase, recommended for ion-trap detectors

 Optimum column for confirmation of analytical results in combination with a 1 MS or 5 MS

Polymer without CN groups

Recommended application: allround phase for environmental analyses, ultra trace analyses, EPA methods, pesticides, PCB, food and drug analyses

USP G42

#### OPTIMA® 17

Medium polar phase

Similar phases: OV-17, DB-17, HP-50+, HP-17, SPB-50, SP-2250, Rxi-17, Rtx-50, CP-Sil 24 CB, 007-17, ZB-50

#### phenylmethylpolysiloxane (50% phenyl)

Max. temperature for isothermal operation 320 °C, max. temperature for short isotherms in a temperature program 340 °C for 0.53 mm ID columns the max. temperatures are 300 and 320 °C, resp.

Recommended application: steroids, pesticides, drug analyses

USP G3

#### OPTIMA® 17 MS

 Medium polar silarylene phase with selectivity analogue to 50 % phenyl – 50 % methylpolysilox ane

Similar phases: OV-17, AT-50, BPX-50, DB-17, DB-17ms, HP-50+, HP-17, SPB-50, SPB-17, SP-2250, Rtx-50, CP-Sil 24 CB, 007-17, VF-17ms, ZB-50

#### silarylene phase

Max. temperature for isothermal operation 340 °C, max. temperature for short isotherms in a temperature program 360 °C

 Ideal for ion trap detectors
 Optimum reference column in combination with a 1 MS or 5 MS

No CN groups in the polymer

Recommended application: all-round phase for environmental analyses, ultra-trace analyses, EPA methods, pesticides, PCBs, food and drug analyses

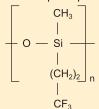

USP G3

#### **OPTIMA® 210**

Medium polar phase

#### trifluoropropyl-methylpolysiloxane (50% trifluoropropyl)

Max. temperature for isothermal operation 260 °C, max. temperature for short isotherms in a temperature program 280 °C

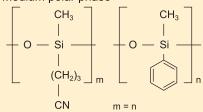

- Recommended application: environmental analyses, especially for o-, m- and p-substituted aromatic hydrocarbons
- Close equivalent to USP G6

Similar phases: OV-210, DB-210, Rtx-200, 007-210

#### OPTIMA® 225

#### 50% cyanopropyl-methyl - 50% phenylmethylpolysiloxane

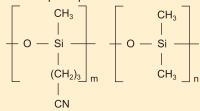

Medium polar phase

- Max. temperature for isothermal operation 260 °C, max. temperature for short isotherms in a temperature program 280 °C
  - Recommended for fatty acid analyses Similar phases: DB-225, HP-225, OV-225, Rtx-225, CP-Sil 43, 007-225, BP225
  - Close equivalent to USP G7 / G19

#### OPTIMA® 240

Medium polar phase

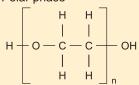

#### 33% cyanopropyl-methyl - 67% dimethylpolysiloxane

Max. temperature for isothermal operation 260 °C, max. temperature for short isotherms in a temperature program 280 °C

Recommended for FAMEs, dioxins No similar phases

#### **OPTIMA** ® WAX

Polar phase

Similar phases: PERMABOND ® CW 20 M (page 265), DB-Wax, Supelcowax, HP-Wax, HP-INNOWAX, Rtx-Wax, CP-Wax 52 CB, Stabilwax, 007-CW, BP20, AT-Wax, ZB-Wax

USP G16

#### polyethylene glycol 20 000 Da

- Columns with 0.25–0.32 mm ID: max. temperature for isothermal operation 240 °C, max. temperature for short isotherms in a temperature program 250 °C; 0.53 mm ID columns: max. temperatures 220 and 240 °C, resp.
- Recommended application: solvent analysis and alcohols, suitable for aqueous solutions

#### **OPTIMA WAXplus** ®

 Polar phase with improved cross-linking for lower column bleed and better temperature stability

$$H = \begin{bmatrix} H & H \\ I & I \\ O - C - C \\ I & I \\ H & H \end{bmatrix}_n$$

\_\_\_\_\_\_\_ USP G16

#### cross-linked polyethylene glycol

Max. temperature for isothermal operation 260 °C, max. temperature for short isotherms in a temperature program 270 °C

Recommended application: broad range of application, e.g., for solvents and alcohols, suitable for aqueous solutions Similar phases: OPTIMA ® WAX (previous page), DB-Wax, Supelcowax, HP-Wax, HP-INNOWAX, Rtx-Wax, CP-Wax 52 CB, Stabilwax, 007-CW, BP20, AT-Wax, ZB-Wax

#### **OPTIMA** ® **FFAP**

Polar phase

$$\begin{bmatrix} O & O \\ C & - C \\ O_2N \end{bmatrix} = \begin{bmatrix} O & O \\ C & - (OCH_2CH_2)_m - O \end{bmatrix}$$

Similar phases: PERMABOND® FFAP (page 265), DB-FFAP, HP-FFAP, CP-Wax 58 (FFAP) CB, 007-FFAP, CP-FFAP CB, Nukol, BP21

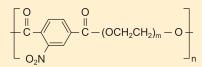

#### polyethylene glycol 2-nitroterephthalate

Columns with 0.10–0.32 mm ID: max. temperature for isothermal operation 240 °C, max. temperature for short isotherms in a temperature program: 250 °C 0.53 mm ID columns: max. temperatures 220 and 240 °C, resp.

- Recommended application: fatty acid methyl esters (FAMEs), free carboxylic acids
- USP G35 / close equivalent to G25

#### **OPTIMA** ® **FFAPplus**

Polar phase

Similar phases: OPTIMA <sup>®</sup> FFAP (previous page), DB-FFAP, HP-FFAP, CP-Wax 58 (FFAP) CB, 007-FFAP, CP-FFAP CB, Nukol

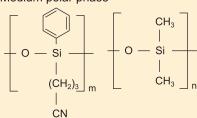

#### polyethylene glycol 2-nitroterephthalate

Max. temperature for isothermal operation 250 °C, max. temperature for short isotherms in a temperature program 260 °C

- Recommended application: FAMEs, free carboxylic acids
- USP G35 / close equivalent to G25

#### **OPTIMA** ® 1301

Medium polar phase

#### 6% cyanopropyl-phenyl-94% dimethylpolysiloxane

Max. temperature for isothermal operation 300 °C, max. temperature for short isotherms in a temperature program 320 °C

O Ideal for pesticide analyses
For corresponding columns with higher film thickness see OPTIMA <sup>®</sup> 624
Similar phases: HP-1301, DB-1301, SPB-1301, Rtx-1301, CP-1301, 007-1301

USP G43

# PERMABOND® capillary columns

#### PERMABOND® SE-30

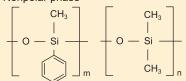

Nonpolar phase

#### 100% dimethylpolysiloxane

Max. temperature for isothermal operation 300 °C, max. temperature for short isotherms in a temperature

#### PERMABOND® SE-52

Nonpolar phase

#### 5 % phenyl - 95% dimethylpolysiloxane

Max. temperature for isothermal operation 300 °C, max. temperature for short isotherms in a temperature

#### PERMABOND® CW 20 M

Polar phase

Similar phases see OPTIMA ® WAX page 260

#### polyethylene glycol 20000 Da

0.1–0.32 mm ID: max. temperature for isothermal operation 220 °C, max. temperature for short isotherms in a temperature program 240 °C 0.53 mm ID: max. temperatures 200 and 220 °C, resp.

Recommended for solvent analyses and alcohols
 Suitable for aqueous solutions

•

#### PERMABOND® FFAP

Polar phase

$$\begin{bmatrix} O & O \\ \parallel & - & - \\ O_2 N & - & - \\ \end{bmatrix} - \begin{bmatrix} O & O \\ \parallel & - \\ O & - \\$$

#### polyethylene glycol 2-nitroterephthalate

0.1–0.32 mm ID: max. temperature for isothermal operation 220 °C, max. temperature for short isotherms in a temperature program 240 °C; 0.53 mm ID: max. temperatures 200 and 220 °C, resp.

Recommended for FAME, free carboxylic acids

# **OPTIMA** <sup>®</sup> δ · unique phases with autoselectivity

#### OPTIMA® δ-6

Medium polar without CN groups
 Analytes determine the polarity of the phase

Unique from MN, no similar phase Ideal for MSD and PND detectors

#### polysiloxane phase with autoselectivity

Max. temperature for isothermal operation 340 °C, max. temperature for short isotherms in a temperature program 360 °C; 0.53 mm ID columns: max. temperatures 320 and 340 °C, resp.

Autoselectivity resulting in a wide range of polarities from approximately the midpolar OPTIMA <sup>®</sup> 17 to the polar OPTIMA<sup>®</sup> 210 (see page 241)

#### OPTIMA<sup>®</sup> δ-3

Medium polar without CN groups
 Analytes determine the polarity of the phase

Unique from MN, no similar phase Ideal for MSD and PND detectors

USP G49

#### polysiloxane phase with autoselectivity

Max. temperature for isothermal operation 340 °C, max. temperature for short isotherms in a temperature program 360 °C; 0.53 mm ID columns: max. temperatures 320 and 340 °C, resp.

 Autoselectivity resulting in a wide range of polarities from approximately the non-polar OPTIMA <sup>®</sup> 5 to the midpolar OPTIMA<sup>®</sup> 1701 Vials and accessories

# **Crimping tools**

chromatography

#### **Manual crimping tools**

#### **Advanced ergonomic version**

#### Available for 11 mm and 20 mm crimp caps

- · More lightweighted than complete steel crimpers
- Ergonomically designed handles
- · Adjustment by a knob on the crimping head that is easily accessible and visible
- · Activated by bottom handle motion only which allows a steadier and safer hold of the tool during crimping
- Due to design and alignment of the crimping head better vertical clearance over the vial
- Advanced ergonomic decappers allow safe removal of caps; no adjustment required

#### Standard version

#### Available for 8, 11, 13, and 20 mm crimp caps

- · Adjustable crimping height via hexagon key, which allows to move the inner part of the crimping head up and down (not possible for manual crimpers N 8)
- · Crimping pressure adjustable via screw in the
- Manual crimpers for N 13 and N 20 Flip Top/ Flip Off caps (pharmaceutical closures) available
- · Long life time and convenient handling
- Manual decappers (standard version) allow safe removal of caps; no adjustment required

Description	Pack of	REF
Manual crimpers (ergonomic)		
(crimping pressure adjustable by knob on the crimping head)		
Manual ergonomic crimper for 11 mm aluminium crimp caps	1	735211
Manual ergonomic crimper for 20 mm aluminium crimp caps	1	735220
Manual decappers (ergonomic)		
Manual ergonomic decapper for 11 mm aluminium crimp caps	1	735311
Manual ergonomic decapper for 20 mm aluminium crimp caps	1	735320
Manual crimpers (standard)		
Manual crimper for 8 mm aluminium crimp caps	1	735126
Manual crimper, height adjustable, for 11 mm aluminium crimp caps	1	735111
Manual crimper, height adjustable, for 13 mm aluminium crimp caps	1	735113
Manual crimper, height adjustable, for 13 mm Flip Top / Flip Off caps	1	735133
Manual crimper, height adjustable, for 20 mm aluminium crimp caps	1	735120
Manual crimper, height adjustable, for 20 mm Flip Top / Flip Off caps	1	735132
Manual decappers (standard)		
Manual decapper for 8 mm aluminium crimp caps	1	735408
Manual decapper for 11 mm aluminium crimp caps	1	735911
Manual decapper for 13 mm aluminium crimp caps	1	735913
Manual decapper for 20 mm aluminium crimp caps	1	735920

# **Crimping tools**

#### **Electronic crimping tools**

#### **Battery-powered electronic crimping tools**

for 11 mm and 20 mm aluminium crimp caps (not suitable for 20 mm magnetic / bi-metal crimp caps)

- Mobile tools for consistent and reproducible crimping results
  - Crimping pressure adjustable by pushing +/– buttons of the control unit on top of the tool
  - Long lasting lithium ion cell batteries (full battery charge for several hundred vials, life time of battery > 1500 charges)
  - CE certificate of conformity along with one year warranty
  - One tool each necessary for crimping and for decapping

#### **Electronic high power crimping tool**

for 11 mm and 20 mm crimp caps (also suitable for magnetic / bi-metal crimp caps)

- Due to a more powerful motor also suitable for magnetic and bi-metal crimp caps
  - · Fixed power supply
  - Exchangeable crimping / decapping heads
  - Digital LED display of crimp settings; different jaw settings can be stored in separate programs
  - CE certificate of conformity along with one year warranty
  - For more convenient handling a stand is optionally available

		555
Description	Pack of	REF
Electronic crimpers (battery-powered)		
Electronic crimper for 11 mm aluminium crimp caps	1	735511
Electronic crimper for 20 mm aluminium crimp caps (not suitable for magnetic / bi-metal crimp caps)	1	735520
Electronic decappers (battery-powered)		
Electronic decapper for 11 mm aluminium crimp caps	1	735611
Electronic decapper for 20 mm aluminium crimp caps (not suitable for magnetic / bi-metal crimp caps)	1	735620
Accessories for battery-powered electronic crimping/decapping tools		
Replacement battery 6.4 Volt, 8.6 Wh		735500
Electronic high power crimping tool		
Electronic high power crimping tool with power supply (exchangeable crimping / decapping heads separately available)	1	735700
Accessories for 735700		
Crimping head for 11 mm crimp caps (for electronic high power crimping tool 735700)	1	735711
Crimping head for 20 mm crimp caps (aluminium, magnetic, bi-metal)	1	735720
(for electronic high power crimping tool 735700)		
Decapping head for 11 mm crimp caps (for electronic high power crimping tool 735700)	1	735811
Decapping head for all 20 mm crimp caps (for electronic high power crimping tool 735700)	1	735820
Stand for electronic crimping tools	1	735501

# **CHROMABOND** ® HR-X pert

#### The professional concept of innovative SPE phases

The CHROMABOND <sup>®</sup> HR-Xpert family comprises 5 polymer-based RP and mixed-mode ion exchange phases:

- CHROMABOND ® HR-X

hydrophobic PS/DVB copolymer

· CHROMABOND ® HR-XC

strong mixed-mode cation exchanger

CHROMABOND ® HR-XA

strong mixed-mode anion exchanger

CHROMABOND ® HR-XCW

weak mixed-mode cation exchanger

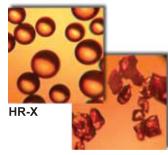

CHROMABOND ® HR-XAW

weak mixed-mode anion exchanger

# Solid Phase Extraction

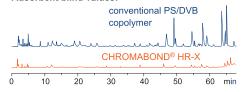

#### These innovative SPE phases offer

- State-of-the-art spherical polymer
  - Two particle sizes (45 μm and 85 μm) adequate for different sample volumes and matrices
  - Broad spectrum of application with special suitability for enrich ment of pharmaceuticals from biological matrices
  - · Ideal flow properties due to low content of particulate matter
- Optimized pore structure and high specific surface
  - · High loadability and outstanding elution properties
  - Low solvent consumption
  - · Rapid, economical analyses
- High-purity adsorber material
  - · Allows highest reproducibility with extremely low blind values
  - · Reliable analyses at ultra trace level
  - · No method adaptation for new batches necessary

conventional PS/DVB copolymer

#### Adsorbent blind values:

#### The HR-Xpert concept guarantees:

- RP and mixed-mode SPE phases with distinct ion exchange and reversed phase properties: excellent enrichment of neutral, acidic and basic compounds
- Modern, spherical support polymer with optimized pore structure and high surface: good reproducibility, reliable and cost-efficient analysis
- Possibility for more aggressive washing procedures for matrix removal: cleaner samples and protection of your HPLC and GC instruments
- Quantification of analytes also from heavily contaminated samples: lower limits of detection also for critical matrices

CHROMABOND® HR-X pert is the perfect combination for all tasks in sample preparation

# CHROMABOND® HR-X pert

#### **Chemical structures of the phases:**
